

# Wissam Elevator Displays

## Wissam Elevator Position Displays

### General Description:

- Wissam Company manufactures several types of position indicators with/without arrows.
- The elevator position display is used to indicate the position of an elevator cabinet during the travel or stop of the cabinet with scrolling feature. The direction arrows are displayed according to the state of the up and down inputs.
- The car (cabinet) position is based on its current gray code or binary code as outputted by the elevator controller.
- The position indicator is sold as a PCB only and you can integrate it in your system and add additional mechanical parts.
- The display has an EEPROM memory to store:
  1. What is to be shown on the position for each stop (for example B for first stop, G for ground floor, MZ for mezanene floor ...etc). Any two English characters can be assigned for each stop.
  2. The scroll direction of the position digits. The scroll is either in the same car direction or opposite to the car direction.
- Small programmer units and PC software is provided to program each display.
- This programmer is available for sale. If for few pieces we can preprogrammed.

### General Options:

Wissam elevator position indicators may be:

- Red or green digit
- Binary code or gray code for inputs (G0,G1,G2,G3,G4)
- In case of linear floor selectors, a Gray Code Encoder can be supplied to generate the required Gray code for the displays.

- The direction arrow state is as follows depending on the up and down inputs.

Up input	Down input	Display arrow direction
1	0	up
0	1	down
0	0	off
